Android modders, rejoice! The team over at CyanogenMod has released a new update to its jailbreaking software, giving you the power to tinker with even more cellphone models. After technical issues caused a short delay in its release, CyanogenMod 7.1 is now available from the project's large mirror network. There are a number of small tweaks, such as support for tethering via Bluetooth, but but most significant change is that it comes loaded with Gingerbread 2.3.7 and now supports a plethora of devices. The 60 model-strong list of supported devices includes the Sony Ericsson Xperia family, Samsung models such as the Galaxy S, and a few Motorola models like the Defy and Droid X. While the CyanogenMod team says that the update is very easy to install and can be done so directly, they recommend the best way to get CyanogenMod 7.1 up and running is with ROM Manager. Installation tips are available over on the CyanogenMod wiki. CyanogenMod is working to improve relations between the modding community and phone vendors, hence the new list of modifiable Sony Ericsson models. It's also working on a project to show manufacturers how modding could in fact be beneficial, and how to get involved. After 7.1, the team will release a few more minor updates to the software before moving onto something bigger: CyanogenMod 9 (what happened to 8?). You can check out the changelog to see what's changed on CyanogenMod's GitHub. [CyanogenMod] Get your GeekTech on: Twitter - Facebook - RSS | Tip us off The HTC Tilt (AKA Kaiser). Photograph: Rob Cardin As a long-time Windows Mobile user who finally gave up on it and switched to an Android phone, I've been thrilled with the new operating system. Now, it looks like others who are fed up with WinMo might be able to switch a little more easily. Over at XDA-developers, a forum where developers post hacks, tips, and software, a developer has released a beta ROM of Android 2.1 for four Windows Mobile phones, all by HTC: the Tilt for AT&T (AKA the HTC Kaiser), Vogue, Niki, and Polaris. That means that four phones that aren't built with Android at all have Android 2.1 before some native Android phones, like the Hero and the Droid Eris. Installing the ROM requires "rooting" your phone, which takes some know-how, but for those not faint of heart or worried about breaking their phone, or maybe those just that tired of Windows Mobile, it's a great solution. There are detailed instructions, and a lot of helpful people, available on the XDA site. It's a beta version, which means there are some bugs, including two notable ones: the Bluetooth features are totally unpredictable, and the camera doesn't work at all. For some other bugs, the XDA forum is talking about and fixing a lot of the problems people are having with their changes. It's probably not the optimal solution for improving your cell phone fortunes, but if you're stuck with your phone for a while and can't wait to get to Android, it's a great solution.
